1 Introduction

This document describes the syntax and semantics of a substantial fragment of Objective Caml's core language. When writing this semantics, we have followed the structure of part 2 of the Objective Caml manual:

The Objective Caml system

release 3.09

Documentation and user's manual

Xavier Leroy (with Damien Doligez, Jacques Garrigue, Didier Rémy and Jérôme Vouillon)

Copyright © 2005 Institut National de Recherche en Informatique et en Automatique

Our aim is to describe a real language, including theoretically redundant but practically useful features. We do not however cover the whole Objective Caml language: we have omitted some major semantic features, such as objects and modules. Our guideline is to retain the semantic features of core ML as implemented in Objective Caml. Our language corresponds roughly to the fragment presented in Chapter 1 of the Objective Caml manual.

Supported features include:

- the following primitive types and type constructors: int, char, string, float, bool, unit, exn, list, option, ref;
- tuple and function types
- type and type constructor definitions, including:
 - type abbreviations (e.g., type t = int),
 - variant data and record types (e.g., type t = I of int | D of char and type t = {f:int}),
 - parametric type constructors (e.g., type 'a t = 'a -> 'a),

- recursive and mutually recursive combinations of the above (although all recursion must go through a variant data or record type);
- let-based polymorphism (with the traditional ML-style value restriction);
- 31-bit word semantics for integers and IEEE-754 semantics for floating point numbers (in the version of the system generated for HOL);
- type annotations (e.g., 3:int), list notation (e.g., [1; 2; 3]), record with expressions, if expressions, while expressions, for expressions, sequencing (;), assert expressions;
- (potentially) mutually-recursive function definitions;
- pattern matching with nested patterns and } patterns;
- mutable references through ref, :=, and !;
- exception definitions and handling (try, raise, exception);
- polymorphic equality (the = operator).

The following features are not supported:

- mutable records (e.g., {mutable l1=e1; ...; mutable ln=en});
- arrays;
- modules:
- subtyping, labels, polymorphic variants, objects;
- pattern matching guards (when);
- features documented in the "language extensions" part of the manual;
- \bullet -rectypes, exhaustivity of pattern matching, and other compiler command-line options;
- support for type abbreviations in the HOL model (we explain in the commentary how they should be added);
- finiteness of memory.

This document contains a description of the language syntax (§2), a type system (§3) and an operational semantics (§4).

Metatheory This typeset definition is generated by ott. Well-formed definitions in HOL, Isabelle/HOL and Coq are also generated. We have mechanized the type soundness theorem for the system in HOL.

2 Syntax

We describe the syntax of the core OCaml language in BNF form, closely following the description in the Objective Caml manual, but omitting unsupported language features. The concrete syntax of Objective Caml includes lexical specifications as well as precedence rules to disambiguate the grammar; we do not reproduce these here.

Some productions mention annotations to the right of the right-hand side. The following annotations are understood by Ott.

- M indicates a metaproduction. These are not part of the free grammar for the relevant nonterminal. Instead they are given meaning (in the theorem prover models) by translation into non-metaproductions. These translations, specified in the Ott source, are specific to each theorem prover. We summarize their action in this document.
- S indicates a metaproduction that is implemented as syntactic sugar.
- "bind ..." and "auxfun = ..." are Ott binding specifications.

The following annotations are for informational purposes only.

- [I] indicates a production that is not intended to be available in user programs but is useful in the metatheory.
- [L] indicates a library facility (as opposed to a strictly language facility).
- d indicates a definition-level feature, if enabled.

3 Type system

The Objective Caml manual does not describe the type system. Therefore our semantics is driven by an attempt to mirror what the Objective Caml implementation does, drawing inspiration from various presentations of type systems for ML. Some notable aspects of the formalization follow:

- We give a declarative presentation of polymorphic typing, i.e., without unification.
- Polymorphic let introduces type variables which are encoded with de Bruijn indices.
- Several rules have premises that state there are at least 1 (or 2) elements of a list, despite there being 3 or 4 dots. This is because Ott does not use dot imposed length restrictions in the theorem prover models.
- Occasionally, we state that some list X1 .. Xm has length m. Ott does not impose this restriction in the theorem prover models either.

3.1 dom(EB) > name Environment binding domain

Gets the name of an environment entry.

$$\overline{\operatorname{dom}\left(\operatorname{TV}\right) \, \rhd \, \operatorname{TV}} \quad \operatorname{\mathsf{JdomEB_type_param}} \\ \overline{\operatorname{dom}\left(\operatorname{value_name} : \operatorname{typescheme}\right) \, \rhd \, \operatorname{value_name}} \quad \operatorname{\mathsf{JdomEB_value_name}} \\ \overline{\operatorname{dom}\left(\operatorname{constr_name} \, \operatorname{of} \, \operatorname{typeconstr}\right) \, \rhd \, \operatorname{constr_name}} \quad \operatorname{\mathsf{JdomEB_const_constr_name}} \\ \overline{\operatorname{dom}\left(\operatorname{constr_name} \, \operatorname{of} \, \forall \, \operatorname{type_params_opt}, (t_1, \ldots, t_n) : \operatorname{typeconstr}\right) \, \rhd \, \operatorname{constr_name}} \quad \operatorname{\mathsf{JdomEB_constr_name}} \\ \overline{\operatorname{dom}\left(\operatorname{typeconstr_name} : \operatorname{kind}\right) \, \rhd \, \operatorname{typeconstr_name}}} \quad \operatorname{\mathsf{JdomEB_trans_typeconstr_name}} \\ \overline{\operatorname{dom}\left(\operatorname{type_params_opt} \, \operatorname{typeconstr_name} = t\right) \, \rhd \, \operatorname{typeconstr_name}}} \quad \operatorname{\mathsf{JdomEB_trans_typeconstr_name}} \\ \overline{\operatorname{dom}\left(\operatorname{typeconstr_name} : \operatorname{kind}\left\{\operatorname{field_name_1}; \, \ldots; \operatorname{field_name_n}\right\}\right) \, \rhd \, \operatorname{typeconstr_name}}} \quad \operatorname{\mathsf{JdomEB_record_typeconstr_name}} \\ \overline{\operatorname{dom}\left(\operatorname{field_name} : \, \forall \, \operatorname{type_params_opt}, \operatorname{typeconstr_name} \, \rightarrow \, \operatorname{typexpr}\right) \, \rhd \, \operatorname{field_name}}} \quad \operatorname{\mathsf{JdomEB_record_field_name}} \\ \overline{\operatorname{dom}\left(\operatorname{location} : t\right) \, \rhd \, \operatorname{location}}} \quad \operatorname{\mathsf{JdomEB_location}}$$

3.2 $|\mathbf{dom}(E)| > names$ Environment domain

Gets all of the names in an environment.

$$\begin{array}{c|c} \hline \mathbf{dom}\,(\mathbf{empty}) & \rhd & \mathsf{JdomE_empty} \\ \\ \mathbf{dom}\,(E) & \rhd & name_1 \dots name_n \\ \hline \mathbf{dom}\,(EB) & \rhd & name \\ \hline \mathbf{dom}\,(E,EB) & \rhd & name \, name_1 \dots name_n \end{array} \mathsf{JdomE_cons}$$

3.3 $E \vdash name \rhd EB$ Environment lookup

Returns the rightmost binding that matches the given name.

$$\begin{array}{c} \mathbf{dom}\left(EB\right) \ \rhd \ name' \\ name \ \neq \ name' \\ name' \ \neq \mathbf{TV} \\ \hline E \vdash name \ \rhd \ EB' \\ \hline E, EB \vdash name \ \rhd \ EB' \\ \hline \hline E, TV \vdash name \ \rhd \ \mathbf{shift} \ 0 \ 1 \ EB' \\ \hline \hline \mathbf{dom}\left(EB\right) \ \rhd \ name \\ \hline E, EB \vdash name \ \rhd \ EB \end{array} \quad \text{Jlookup_EB_rec2}$$

3.4 $E \vdash idx \text{ bound}$ Well-formed index

Determines whether an index is bound by an environment.

$$\begin{array}{c|c} E \vdash idx \, \mathbf{bound} \\ \mathbf{dom} \, (EB) \; \rhd \; name \\ \underline{name \; \neq \; \mathbf{TV}} \\ \hline E, EB \vdash idx \, \mathbf{bound} \\ \hline E \vdash idx \, \mathbf{bound} \\ \hline E, \mathbf{TV} \vdash idx + 1 \, \mathbf{bound} \\ \hline \hline E, \mathbf{TV} \vdash 0 \, \mathbf{bound} \\ \end{array} \quad \begin{array}{c} \mathsf{Jidx_bound_skip2} \\ \hline \end{array}$$

3.5 \[\dagger \text{type_params_opt} : \text{kind} \] Type parameter kinding

Counts the number of parameters and ensures that none is repeated.

$$\frac{tp_1 \dots tp_n \operatorname{\mathbf{distinct}}}{\operatorname{\mathbf{length}}(tp_1) \dots (tp_n) = n} \\ \vdash (tp_1, \dots, tp_n) : \mathbf{Type}^n \to \mathbf{Type}$$
 JTtps_kind_kind

3.6 $E \vdash ok$ Environment validity

Asserts that the various components of the environment are well-formed (including that there are no free type references), and regulates name shadowing. Environments contain identifiers related to type definitions and type variables as well as expression-level variables (i.e., value names), so they are dependent from left to right. Shadowing of type, constructor, field and label names is forbidden, but shadowing of value names is allowed.

```

3.7 $E \vdash typeconstr : kind$ Type constructor kinding

Ensures that the type constructor is either defined in the environment or built-in. The result kind indicates how many parameters the type constructor expects.

$$\frac{E \vdash \mathbf{ok}}{E \vdash \mathbf{ref} : \mathbf{Type}^1 \to \mathbf{Type}} \quad \mathsf{JTtypeconstr_ref}$$

3.8 $E \vdash typescheme : kind$ de Bruijn type scheme well-formedness

Ensures that the type is well-formed in an extended environment.

$$\frac{E, \mathbf{TV} \vdash t : \mathbf{Type}}{E \vdash \forall \, t : \mathbf{Type}} \quad \mathsf{JTts_forall}$$

3.9 $E \vdash \forall type_params_opt, t : kind$ Named type scheme well-formedness

Ensures that the named type paramaters are distinct, and that the type is well-formed. Instead of extending the environment, this simply substitutes a collection of well-formed types, here **unit**. This works because the type well-formedness judgment below only depends on well-formedness of sub-expressions, and not on the exact form of sub-expressions.

$$\frac{E \vdash \{\!\!\{\alpha_1 \leftarrow \mathbf{unit}, \ldots, \alpha_n \leftarrow \mathbf{unit}\}\!\!\} \ t : \mathbf{Type}}{\alpha_1 \ldots \alpha_n \ \mathbf{distinct}} \\ \underline{\qquad \qquad \qquad } \\ E \vdash \forall (\alpha_1, \ldots, \alpha_n), t : \mathbf{Type}$$
 JTtsnamed_forall

3.10 $E \vdash typexpr : kind$ Type expression well-formedness

Ensures that all of the indices and constructors that appear in a type are bound in the environment.

$$\begin{array}{c} E \vdash \mathbf{ok} \\ E \vdash idx \, \mathbf{bound} \\ \hline E \vdash < idx, num >: \mathbf{Type} \\ \hline E \vdash t : \mathbf{Type} \\ \hline E \vdash t' : \mathbf{Type} \\ \hline E \vdash t \to t' : \mathbf{Type} \\ \hline E \vdash t \to t' : \mathbf{Type} \\ \hline \end{bmatrix} \mathsf{JTt_arrow} \\ E \vdash t_1 : \mathbf{Type} \quad \dots \quad E \vdash t_n : \mathbf{Type} \\ \hline \end{bmatrix} \mathsf{length} (t_1) \dots (t_n) \geq 2 \\ \hline E \vdash t_1 * \dots * t_n : \mathbf{Type} \\ \hline \end{bmatrix} \mathsf{JTt_tuple} \\ \hline$$

$$E \vdash typeconstr : \mathbf{Type}^n \to \mathbf{Type}$$

$$E \vdash t_1 : \mathbf{Type} \quad \dots \quad E \vdash t_n : \mathbf{Type}$$

$$\frac{\mathbf{length}(t_1) \dots (t_n) = n}{E \vdash (t_1, \dots, t_n) typeconstr : \mathbf{Type}}$$

$$\mathsf{JTt_constr}$$

3.11 $E \vdash typexpr \equiv typexpr'$ Type equivalence

Checks whether two types are related (potentially indirectly) by the type abbreviations in the environment. The system does not allow recursive types that do not pass through an opaque (generative) type constructor, i.e., a variant or record. Therefore all type expressions have a canonical form obtained by expanding all type abbreviations.

 $\frac{E \vdash t : \mathbf{Type}}{E \vdash t = t} \quad \mathsf{JTeq_refl}$

$$\frac{E \vdash t' \equiv t'}{E \vdash t \equiv t'} \quad \mathsf{JTeq_sym}$$

$$\frac{E \vdash t \equiv t'}{E \vdash t' \equiv t''} \quad \mathsf{JTeq_trans}$$

$$E \vdash \mathbf{ok}$$

$$E \vdash typeconstr_name \quad \rhd \quad (\alpha_1, \ldots, \alpha_n) \ typeconstr_name = t$$

$$E \vdash t_1 : \mathbf{Type} \quad \ldots \quad E \vdash t_n : \mathbf{Type}$$

$$E \vdash (t_1, \ldots, t_n) typeconstr_name \equiv \{\!\{\alpha_1 \leftarrow t_1, \ldots, \alpha_n \leftarrow t_n\}\!\} \ t$$

$$E \vdash t_1 \equiv t'_1$$

$$E \vdash t_2 \equiv t'_2$$

$$E \vdash t_1 \Rightarrow t'_2 \Rightarrow t'_1 \Rightarrow t'_2$$

$$E \vdash t_1 \Rightarrow t'_1 \quad \ldots \quad E \vdash t_n \equiv t'_n$$

$$\frac{\mathsf{length} \ (t_1) \ldots (t_n) \geq 2}{E \vdash t_1 * \ldots * t_n \equiv t'_1 * \ldots * t'_n} \quad \mathsf{JTeq_tuple}$$

$$E \vdash typeconstr : \mathbf{Type}^n \Rightarrow \mathbf{Type}$$

$$E \vdash t_1 \equiv t'_1 \quad \ldots \quad E \vdash t_n \equiv t'_n$$

$$\mathsf{length} \ (t_1) \ldots (t_n) = n$$

$$\mathsf{length} \ (t_1) \ldots (t_n) = n$$

$$\mathsf{ITeq_constr} \quad \mathsf{JTeq_constr}$$

3.12 $\{typexpr_1, ..., typexpr_n\}typexpr' > typexpr''$ de Bruin type substitution

Replaces index 0 position n with the nth type in the list, and reduces all other indices by 1.

3.13 $E \vdash typexpr \leq typescheme$ de Bruijn type scheme instantiation

Replaces all of the bound variables of a type scheme.

$$E \vdash \forall t' : \mathbf{Type}$$

$$E \vdash t_1 : \mathbf{Type} \quad .. \quad E \vdash t_n : \mathbf{Type}$$

$$\frac{\{\!\{t_1, ..., t_n\}\!\}t' \; \rhd \; t''}{E \vdash t'' < \forall \; t'} \qquad \mathsf{JTinst_idx}$$

3.14 $E \vdash typexpr \leq \forall type_params_opt, typexpr'$

Named type scheme instantiation

Replaces all of the bound variables of a named type scheme.

$$\frac{E \vdash \forall (\alpha_1, \dots, \alpha_n), t : \mathbf{Type}}{E \vdash t_1 : \mathbf{Type} \quad \dots \quad E \vdash t_n : \mathbf{Type}} \\ \frac{E \vdash \{\!\!\{ \alpha_1 \leftarrow t_1, \dots, \alpha_n \leftarrow t_n \}\!\!\} \ t \leq \forall (\alpha_1, \dots, \alpha_n), t}$$
 JTinst_named_named

3.15 $E \vdash typexpr \leq typexpr'$ Wildcard type instantiation

Replaces _ type variables with arbitrary types.

$$\frac{E \vdash < idx, num >: \mathbf{Type}}{E \vdash < idx, num > \le < idx, num >} \quad \mathsf{JTinst_any_tyvar}$$

$$\frac{E \vdash t : \mathbf{Type}}{E \vdash t \le -} \quad \mathsf{JTinst_any_any}$$

$$\frac{E \vdash t_1 \le t_1'}{E \vdash t_2 \le t_2'} \quad \mathsf{JTinst_any_arrow}$$

$$\frac{E \vdash t_1 \le t_1' \quad \dots \quad E \vdash t_n \le t_n'}{E \vdash t_1 \le t_1' \quad \dots \quad E \vdash t_n \le t_n'} \quad \mathsf{JTinst_any_arrow}$$

$$\frac{E \vdash t_1 \le t_1' \quad \dots \quad E \vdash t_n \le t_n'}{E \vdash typeconstr : \mathbf{Type}^n \to \mathbf{Type}}$$

$$\frac{E \vdash typeconstr : \mathbf{Type}^n \to \mathbf{Type}}{E \vdash (t_1, \dots, t_n) typeconstr \le (t_1', \dots, t_n') typeconstr} \quad \mathsf{JTinst_any_ctor}$$

3.16 $E \vdash value_name : typexpr$ Variable typing

Determines if a variable can have a specified type.

$$\frac{E \vdash value_name \; \rhd \; value_name : ts}{E \vdash t \leq ts} \\ \hline \frac{E \vdash value_name : t}{} \\ \label{eq:local_problem} \mathsf{JTvalue_name_value_name}$$

3.17 $E \vdash field_name : typexpr \rightarrow typexpr'$ Field name typing

Determines the type constructor associated with a given field name. Since field names are used to destructure record data, the type is a function type from a record to the type of the corresponding position.

 $\frac{E \vdash field_name \; \rhd \; field_name \; : \; \forall \, (\alpha_1, \, \ldots, \, \alpha_m), typeconstr_name \to t}{E \vdash (t'_1, \, \ldots, \, t'_m) typeconstr_name \to t'' \leq \forall \, (\alpha_1, \, \ldots, \, \alpha_m), (\alpha_1, \, \ldots, \, \alpha_m) typeconstr_name \to t}{E \vdash field_name \; : \, (t'_1, \, \ldots, \, t'_m) typeconstr_name \to t''}$ JTfield_name

3.18 $E \vdash constr: typexpr_1 ... typexpr_n \rightarrow typexpr'$ Non-constant constructor typing

Determines the type constructor associated with a given value constructor. Non-constant constructors are attributed types for each argument as well as a return type.

 $\begin{array}{c|c} E \vdash constr_name \; \rhd \; constr_name \; \mathbf{of} \; \forall \; (\alpha_1, \, \ldots, \, \alpha_m), (t_1, \, \ldots, \, t_n) : typeconstr \\ \hline E \vdash (t'_1 * \ldots * t'_n) \to (t''_1, \, \ldots, \, t''_m) typeconstr \leq \; \forall \; (\alpha_1, \, \ldots, \, \alpha_m), (t_1 * \ldots * t_n) \to (\alpha_1, \, \ldots, \, \alpha_m) typeconstr \\ \hline E \vdash constr_name : t'_1 \ldots t'_n \to (t''_1, \, \ldots, \, t''_m) typeconstr \\ \hline E \vdash \mathbf{ok} \\ \hline E \vdash \mathbf{Invalid_argument} : \mathbf{string} \to \mathbf{exn} \end{array} \; \mathsf{JTconstr_p_invarg}$ $\begin{array}{c} E \vdash t : \mathbf{Type} \\ \hline E \vdash \mathbf{Some} : t \to (t \; \mathbf{option}) \end{array} \; \mathsf{JTconstr_p_some}$

3.19 $E \vdash constr: typexpr$ Constant constructor typing

Constant constructors are typed like non-constant constructors without arguments.

 $E \vdash \mathbf{ok}$ $E \vdash constr_name \quad \triangleright \quad constr_name \quad \mathbf{of} \ typeconstr_name$ $E \vdash typeconstr_name \quad \triangleright \quad typeconstr_name : \mathbf{Type}^n \rightarrow \mathbf{Type}$ $E \vdash t_1 : \mathbf{Type} \quad \dots \quad E \vdash t_n : \mathbf{Type}$ $\underline{\mathbf{length}} \ (t_1) \dots (t_n) = n$ $E \vdash constr_name : (t_1, \dots, t_n) typeconstr_name$ $JTconstr_c_constr$

Dropping the source location arguments for Assert_failure and Match_failure.

$$\frac{E \vdash \mathbf{ok}}{E \vdash \mathbf{Division_by_zero} : \mathbf{exn}} \quad \mathsf{JTconstr_c_div_by_0}$$

$$\frac{E \vdash t : \mathbf{Type}}{E \vdash \mathbf{None} : t \ \mathbf{option}} \quad \mathsf{JTconstr_c_none}$$

3.20 $E \vdash constant : typexpr$ Constant typing

Determines the type of a constant.

$$\begin{array}{ll} E \vdash \mathbf{ok} \\ \hline E \vdash \mathbf{true} : \mathbf{bool} \end{array} \quad \mathsf{JTconst_true} \\ \\ \frac{E \vdash \mathbf{ok}}{E \vdash () : \mathbf{unit}} \quad \mathsf{JTconst_unit} \\ \\ \hline E \vdash t : \mathbf{Type} \\ \hline E \vdash [] : t \, \mathsf{list} \end{array} \quad \mathsf{JTconst_nil}$$

3.21 $\sigma^T \& E \vdash pattern : typexpr \triangleright E'$ Pattern typing and binding collection

Determines if a pattern matches a value of a certain type, and calculates the types of the variables it binds. A pattern must bind any given variable at most once, except that the two alternatives of an or-pattern must bind the same set of variables. σ^T gives the types that should replace type variables in explicitly type-annotated patterns.

$$\frac{E \vdash t : \mathbf{Type}}{\sigma^T \& E \vdash x : t \; \rhd \; x : t} \quad \mathsf{JTpat_var}$$

3.23 $E \vdash binary_prim : typexpr$ Binary primitive typing

Determines if a binary primitive has a given type.

$$\begin{array}{ll} E \vdash t : \mathbf{Type} \\ \hline E \vdash =: t \rightarrow (t \rightarrow \mathbf{bool}) \end{array} \quad \mathsf{JTbprim_equal} \\ \\ \frac{E \vdash \mathbf{ok}}{E \vdash +: \mathbf{int} \rightarrow (\mathbf{int} \rightarrow \mathbf{int})} \quad \mathsf{JTbprim_plus} \\ \\ \frac{E \vdash \mathbf{ok}}{E \vdash -: \mathbf{int} \rightarrow (\mathbf{int} \rightarrow \mathbf{int})} \quad \mathsf{JTbprim_minus} \\ \\ \frac{E \vdash \mathbf{ok}}{E \vdash *: \mathbf{int} \rightarrow (\mathbf{int} \rightarrow \mathbf{int})} \quad \mathsf{JTbprim_times} \\ \\ \frac{E \vdash \mathbf{ok}}{E \vdash /: \mathbf{int} \rightarrow (\mathbf{int} \rightarrow \mathbf{int})} \quad \mathsf{JTbprim_div} \\ \\ \frac{E \vdash \mathbf{ok}}{E \vdash :: t \cdot \mathbf{tot} \rightarrow (\mathbf{int} \rightarrow \mathbf{int})} \quad \mathsf{JTbprim_div} \\ \\ \frac{E \vdash t : \mathbf{Type}}{E \vdash :: t \cdot \mathbf{ref} \rightarrow (t \rightarrow \mathbf{unit})} \quad \mathsf{JTbprim_assign} \\ \end{array}$$

3.24 $\sigma^T \& E \vdash expr : typexpr$ Expression typing

Detremines if an expression has a given type. Note that t is a type, not a type scheme, but it may contain type variables (which are recorded in E). σ^T gives the types that should replace type variables in explicitly type-annotated patterns.

While the choice of a rule is mostly syntax-directed (for any given constructor, a single rule applies, except for **let** and **assert**), polymorphism is handled in a purely declarative manner. The choice of instantiation for a polymorphic bound variable or primitive is free, as is the number of variables introduced by a polymorphic **let**.

```
\sigma^T \& E \vdash e_1 : t_1 \quad \dots \quad \sigma^T \& E \vdash e_n : t_n

```

In the above rule, e_1 must have type unit. Ocaml lets the programmer off with a warning, unless -warn-error S is passed on the compiler command line.

We give three rules for **let** expressions. The rule JTe'let'mono describes "monomorphic let": it does not allow the type of *expr* to be generalised. The rule JTe'let'poly describes "polymorphic let": it allows any number of type variables in the type of *nexp* to be generalised (more precisely, this generalisation applies simultaneously to the types of all the variables bound by *pat*), at the cost of requiring *nexp* to be non-expansive (which is described syntactically through the grammar for *nexp*). The rule JTe'letrec allows mutually recursive functions to be defined; since immediate functions are values, thus nonexpansive, there is no need for a monomorphic **let rec** rule.

$$\sigma^T\&E \vdash pat = expr \quad \rhd \quad x_1:t_1,\dots,x_n:t_n$$

$$\sigma^T\&E@x_1:t_1,\dots,x_n:t_n\vdash e:t$$

$$\sigma^T\&E \vdash \mathbf{let} \ pat = expr \ \mathbf{in} \ e:t$$

$$\mathbf{shift} \ 0 \ 1 \ \sigma^T\&E, \mathbf{TV} \vdash pat = nexp \quad \rhd \quad x_1:t_1,\dots,x_n:t_n$$

$$\sigma^T\&E@x_1:\forall \ t_1,\dots,x_n:\forall \ t_n\vdash e:t$$

$$\sigma^T\&E \vdash \mathbf{let} \ pat = nexp \ \mathbf{in} \ e:t$$

$$\mathsf{JTe_let_poly}$$

$$\begin{array}{c} \mathbf{shift} \ 0 \ 1 \ \sigma^T \& E, \mathbf{TV} \vdash letrec_bindings \ \vartriangleright x_1 : t_1, \dots, x_n : t_n \\ \sigma^T \& E @ (x_1 : \forall t_1), \dots, (x_n : \forall t_n) \vdash e : t \end{array} \qquad \qquad \mathsf{JTe_letrec} \\ \hline \sigma^T \& E \vdash \mathbf{let} \ \mathbf{rec} \ letrec_bindings \ \mathbf{in} \ e : t \\ \hline \sigma^T \& E \vdash e : \mathbf{bool} \\ \hline E \vdash \mathbf{unit} \equiv t \\ \hline \sigma^T \& E \vdash \mathbf{assert} \ e : t \end{array} \qquad \mathsf{JTe_assert} \\ \hline E \vdash t : \mathbf{Type} \\ \hline \sigma^T \& E \vdash \mathbf{assert} \ \mathbf{false} : t \\ \hline E \vdash \mathbf{ok} \\ E \vdash location \ \vartriangleright \ location : t \\ E \vdash t \ \mathbf{ref} \equiv t' \\ \hline \sigma^T \& E \vdash location : t' \end{array} \qquad \mathsf{JTe_location}$$

3.25 $\sigma^T \& E \vdash pattern_matching : typexpr \rightarrow typexpr'$ Pattern matching/expression pair typing

Determines the function type of a sequence of pattern/expression pairs. The function type desribes the type of the value matched by all of the patterns and the type of the value returned by all of the expressions. σ^T gives the types that should replace type variables in explicitly type-annotated patterns.

3.26 $\sigma^T \& E \vdash let_binding \rhd E'$ Let binding typing

Determines the types bound by a let bindings pattern.

3.27 $\sigma^T \& E \vdash letrec_bindings \triangleright E'$ Recursive let binding typing

Determines the types bound by a recursive let's patterns (which are always just variables).

$$E' = E@value_name_1 : t_1 \rightarrow t'_1, \dots, value_name_n : t_n \rightarrow t'_n$$

$$value_name_1 : t_1 \rightarrow t'_1, \dots, value_name_n : t_n \rightarrow t'_n$$

3.28 $type_params_opt\ typeconstr \vdash constr_decl > EB$ Variant constructor declaration

Collects the constructors of a variant type declaration using named type schemes for the type parameters.

$$\overline{(\alpha_1,\,\ldots,\alpha_n)\,typeconstr \vdash constr_name \ \triangleright \ constr_name \ \textbf{of}\ typeconstr}} \quad \text{JTconstr_decl_nullary}$$

$$\overline{(\alpha_1,\,\ldots,\alpha_n)\,typeconstr \vdash constr_name \ \textbf{of}\ t_1*\,\ldots*\,t_n \ \triangleright \ constr_name \ \textbf{of}\ \forall\,(\alpha_1,\,\ldots,\alpha_n),(t_1,\,\ldots,t_n):typeconstr}} \quad \text{JTconstr_decl_nary}$$

3.29 $type_params_opt\ typeconstr_name \vdash field_decl \gt EB$ Record field declaration

Collects the fields of a record type using named type schemes for the type parameters.

$$\frac{}{(\alpha_1, \ldots, \alpha_n) \ typeconstr_name \vdash fn : t \ \triangleright \ fn : \ \forall \ (\alpha_1, \ldots, \alpha_n), \ typeconstr_name \rightarrow t} \quad \mathsf{JTfield_decl_only}$$

3.30 $\vdash typedef_1 \text{ and } ... \text{ and } typedef_n \rhd E' \text{ and } E'' \text{ and } E'''$ Type definitions collection

A type definition declares several sorts of names: type constructors (some of them corresponding to freshly generated types, others to type abbreviations), and data constructors and destructors. These names are collected into three environments:

 \bullet E' contains generative type definitions (variant and record types);

- E'' contains type abbreviations;
- \bullet E''' contains constructors and destructors for generative datatypes.

The order E', E'' is chosen so that their concatenation is well-formed, because no component may refer to a subsequent one. The first component E', only contains declarations of names which do not depend on anything. The second component E'' contains type abbreviations topologically sorted according to their dependency order, which is possible since we do not allow recursive type abbreviations (in Objective Caml, without the -rectypes compiler option, recursive type abbreviations are only allowed when guarded polymorphic variants and object types) — recursive types must be guarded by a generative datatype. Finally E''' declares constructors and destructors for the types declared in E'; E''' may refer to types declared in E' or E'' in the types of the arguments to these constructors and destructors.

This judgement form does not directly assert the correctness of the definitions: this is performed by the rule JTtype definition list below, which states that the environment assembled here must be well-formed.

A variant type definition yields two sorts of bindings: one for the type constructor name and one for each constructor.

A record type definition yields two sorts of bindings: one for the type constructor name and one for each field. The field names are also recorded with the type constructor binding; this information is used in the rule JTe record constructor bindings for variant types with their constructor names if we wanted to check the exhaustivity of pattern matching.)

3.31 $E \vdash type_definition \triangleright E'$ Type definition well-formedness and binding collection

Collects the bindings of a type definition and ensures that they are well-formed. Any given name may be defined at most once, and all names used must have been bound previously or earlier in the same type definition phrase. The conditions are checked by the premise $E@E'''' \vdash \mathbf{ok}$ in the rule JTtype definition list and the assembly is performed by the type definitions collection rules above. This implies that the type abbreviations must be topologically sorted in their dependency order. (Generative type definitions are exempt from such constraints.) Programmers do not have to abide by this constraint: they may order type abbreviations in any way. Therefore the rule JTtype definition swap allows an arbitrary reordering of type definitions — it suffices for a type definition to be correct that there exist a reordering that makes the type abbreviations properly ordered.

$$E'''' = E' @ E'' @ E''' \\ E'''' = E' @ E'' @ E''' \\ E @ E'''' \vdash \mathbf{ok} \\ \hline E \vdash \mathbf{type} \ \overline{typedef_i}^i \ \mathbf{and} \ typedef' \ \mathbf{and} \ typedef''^j \ \triangleright \ E' \\ \hline E \vdash \mathbf{type} \ \overline{typedef_i}^i \ \mathbf{and} \ typedef \ \mathbf{and} \ typedef''^j \ \triangleright \ E' \\ \hline E \vdash \mathbf{type} \ \overline{typedef_i}^i \ \mathbf{and} \ typedef \ \mathbf{and} \ typedef''^j \ \triangleright \ E' \\ \hline E \vdash \mathbf{type} \ \overline{typedef_i}^i \ \mathbf{and} \ typedef \ \mathbf{and} \ typedef' \ \mathbf{and} \ \overline{typedef''^j} \ \triangleright \ E' \\ \hline$$

3.32 $E \vdash definition : E'$ Definition typing

Collects the bindings of a definition and ensures that they are well-formed. Each definition can bind zero, one or more names. Type variables that are mentionned by the programmer in type annotations are scoped at this level. Thus, the σ^T substitution is arbitrarily created for each definition to ensure that each type variable is used consistently in the definition.

$$\frac{\sigma^T \& E, \mathbf{TV} \vdash pat = nexp \; \rhd \; (x_1 : t_1'), \dots, (x_k : t_k')}{E \vdash \mathbf{let} \; pat = nexp \; : (x_1 : \forall t_1'), \dots, (x_k : \forall t_k')} \quad \mathsf{JTdefinition_let_poly}$$

$$\frac{\sigma^T \& E \vdash pat = expr \; \rhd \; (x_1 : t_1'), \dots, (x_k : t_k')}{E \vdash \mathbf{let} \; pat = expr \; : (x_1 : t_1'), \dots, (x_k : t_k')} \quad \mathsf{JTdefinition_let_mono}$$

$$\frac{\sigma^T \& E, \mathbf{TV} \vdash letrec_bindings \; \rhd \; (x_1 : t_1'), \dots, (x_k : t_k')}{E \vdash \mathbf{let} \; rec \; letrec_bindings \; : (x_1 : \forall t_1'), \dots, (x_k : \forall t_k')} \quad \mathsf{JTdefinition_letrec}$$

$$\frac{E \vdash \mathbf{type} \; typedef_1 \; \mathbf{and} \; \dots \; \mathbf{and} \; typedef_n \; \rhd \; E'}{E \vdash \mathbf{type} \; typedef_1 \; \mathbf{and} \; \dots \; \mathbf{and} \; typedef_n \; : E'} \quad \mathsf{JTdefinition_typedef}$$

$$\frac{E \vdash \mathbf{ok}}{E \vdash \mathbf{ok}}$$

$$\frac{\mathbf{exn} \vdash constr_decl \; \rhd \; EB}{E \vdash \mathbf{exception} \; constr_decl \; : EB} \quad \mathsf{JTdefinition_exndef}$$

3.33 $E \vdash definitions : E'$ Definition sequence typing

Collects the bindings of a definition and ensures that they are well-typed.

 $\frac{E \vdash \mathbf{ok}}{E \vdash :} \quad \mathsf{JTdefinitions_empty}$

 $\frac{E \vdash definition : E'}{E @ E' \vdash definitions' : E''} \\ \frac{E \vdash definition \ definitions' : E' @ E''}{E \vdash definition \ definitions' : E' @ E''}$

3.34 $E \vdash program : E'$ Program typing

Checks a progam.

 $\frac{E \vdash definitions : E'}{E \vdash definitions : E'} \quad \mathsf{JTprog_defs}$

 $\frac{\sigma^T \& E \vdash v : t}{E \vdash (\%primraise)v :} \quad \mathsf{JTprog_raise}$

3.35 $E \vdash store : E'$ Store typing

Checks that the values in a store have types.

 $\overline{E \vdash \mathbf{empty}:} \quad \mathsf{JTstore_empty}$

 $\frac{E \vdash store : E'}{\{\!\!\{ \}\!\!\} \& E \vdash v : t} \\ \frac{E \vdash store, l \mapsto v : E', (l : t)}{E \vdash store _map}$

3.36 $E \vdash \langle program, store \rangle$ Top-level typing

Checks the combination of a program with a store. The store is typed in an environment that includes its bindings, so that it can contain cyclic structures.

$$\begin{array}{c} E@E' \vdash store : E' \\ \hline E@E' \vdash program : E'' \\ \hline E \vdash \langle program, store \rangle \end{array} \text{ JTtop_defs}$$

3.37 $\sigma^T \& E \vdash L$ Label-to-environment extraction

Used in the proof only

3.38 $\sigma^T \& E \vdash L \rhd E'$ Label-to-environment extraction

Used in the proof only

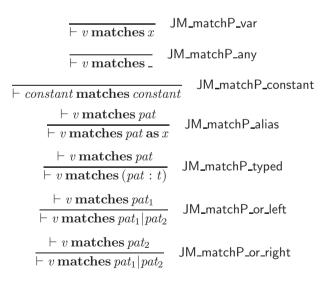

4 Operational Semantics

The operational semantics is a labelled transition system that lifts imperative and non-deterministic behavior our of the core evaluation rules. Notable aspects of the formalization include:

- explicit rules for evaluation in context (instead of a grammar of evaluation contexts),
- small-step propogation of exceptions,
- substitution-based function application,
- right-to-left evaluation ordering, which is overspecified compared to the OCaml manual; furthermore, this choice of evaluation ordering for record expressions differs from the implementation's choice, which is based on the type declaration,
- unlike the implementation, we do not treat curried functions specially, the difference can be seen in this program: let $f = \text{function } 1 \rightarrow \text{function } 1 \rightarrow 10$;; let f = f(2); which does not raise an exception in the implementation.
- As in the type system, several rules have premises that state there are at least 1 (or 2) elements of a list, despite there being 3 or 4 dots. This is because Ott does not use dot imposed length restrictions in the theorem prover models.

4.1 | Expr matches pattern | Pattern matching

Determines if a value matches a pattern.

```
\frac{\vdash v_1 \, \mathbf{matches} \, \mathit{pat}_1 \, \dots \, \vdash v_n \, \mathbf{matches} \, \mathit{pat}_n}{\vdash \, \mathit{constr}(v_1, \dots, v_n) \, \mathbf{matches} \, \mathit{constr}(\mathit{pat}_1, \dots, \mathit{pat}_n)} \quad \mathsf{JM}\_\mathsf{matchP}\_\mathsf{construct}} \\ \frac{\vdash v_1 \, \mathbf{matches} \, \mathit{pat}_1 \, \dots \, \vdash v_n \, \mathbf{matches} \, \mathit{constr}}{} \quad \mathsf{JM}\_\mathsf{matchP}\_\mathsf{construct}\_\mathsf{any}} \\ \frac{\vdash v_1 \, \mathbf{matches} \, \mathit{pat}_1 \, \dots \, \vdash v_n \, \mathbf{matches} \, \mathit{pat}_n}{} \quad \mathsf{JM}\_\mathsf{matchP}\_\mathsf{tuple}} \\ \frac{\vdash v_1 \, \mathbf{matches} \, \mathit{pat}_1 \, \dots \, \vdash v_n \, \mathbf{matches} \, \mathit{pat}_n}{} \quad \mathsf{JM}\_\mathsf{matchP}\_\mathsf{tuple}} \\ \mathsf{field}\_\mathsf{name}'_1 = v'_1 \, \dots \, \mathsf{field}\_\mathsf{name}'_n = v'_n \, \mathsf{fn}_1 = v''_1 \, \dots \, \mathsf{fn}_l = v''_l \, \mathsf{PERMUTES} \, \mathsf{field}\_\mathsf{name}_1 = v_1 \, \dots \, \mathsf{field}\_\mathsf{name}_m = v_m \\ \vdash v'_1 \, \mathbf{matches} \, \mathit{pat}_1 \, \dots \, \vdash v'_n \, \mathbf{matches} \, \mathit{pat}_n \\ \mathsf{field}\_\mathsf{name}_1 \, \dots \, \mathsf{field}\_\mathsf{name}_m \, \mathsf{distinct}} \\ \vdash \{ \mathit{field}\_\mathsf{name}_1 = v_1 \, \colon \dots \, ; \, \mathit{field}\_\mathsf{name}_m = v_m \} \, \mathsf{matches} \, \{ \mathit{field}\_\mathsf{name}'_1 = \mathit{pat}_1 \, ; \, \dots \, ; \, \mathit{field}\_\mathsf{name}'_n = \mathit{pat}_n \} \\ \vdash v_1 \, \mathbf{matches} \, \mathit{pat}_1 \\ \vdash v_2 \, \mathbf{matches} \, \mathit{pat}_1 \\ \vdash v_2 \, \mathbf{matches} \, \mathit{pat}_1 \\ \vdash v_2 \, \mathbf{matches} \, \mathit{pat}_1 \, : \, v_3 \, \mathbf{matches} \, \mathit{pat}_2 \, : \, v_3 \, \mathbf{matches} \, \mathit{pat}_1 \,
```

4.2 $\vdash expr \, \text{matches} \, pattern \, \triangleright \, \{substs_x\} \mid \, \text{Pattern matching with substitution creation}$

Determines if a value matches a pattern and destructures the value into a substitution according to the pattern's variables. The previous pattern matching relation is used to get deterministic behavior for | patterns.

```
 \begin{array}{c} \neg (v \; \mathbf{matches} \; \mathit{pat}_1) \\ \vdash v \; \mathbf{matches} \; \mathit{pat}_2 \; \triangleright \; \{ x_1 \leftarrow v_1, \ldots, x_n \leftarrow v_n \} \\ \vdash v \; \mathbf{matches} \; \mathit{pat}_1 \; | \mathit{pat}_2 \; \triangleright \; \{ x_1 \leftarrow v_1, \ldots, x_n \leftarrow v_n \} \\ \hline \vdash v \; \mathbf{matches} \; \mathit{pat}_1 \; | \mathit{pat}_2 \; \triangleright \; \{ x_1 \leftarrow v_1, \ldots, x_n \leftarrow v_n \} \\ \hline \vdash v_1 \; \mathbf{matches} \; \mathit{pat}_1 \; \triangleright \; \{ \mathit{substs} x_1 \} \; \ldots \; \vdash v_n \; \mathbf{matches} \; \mathit{pat}_n \; \triangleright \; \{ \mathit{substs} x_n \} \\ \hline \vdash \mathit{constr}(v_1, \ldots, v_n) \; \mathbf{matches} \; \mathit{constr}(\mathit{pat}_1, \ldots, \mathit{pat}_n) \; \triangleright \; \{ \mathit{substs} x_1 @ \ldots @ \mathit{substs} x_n \} \\ \hline \vdash \mathit{constr}(v_1, \ldots, v_n) \; \mathbf{matches} \; \mathit{constr} \; \vdash \triangleright \; \{ \} \\ \hline \vdash v_1 \; \mathbf{matches} \; \mathit{pat}_1 \; \triangleright \; \{ \mathit{substs} x_1 \} \; \ldots \; \vdash v_n \; \mathbf{matches} \; \mathit{pat}_n \; \triangleright \; \{ \mathit{substs} x_n \} \\ \hline \vdash (v_1, \ldots, v_n) \; \mathbf{matches} \; (\mathit{pat}_1, \ldots, \mathit{pat}_n) \; \triangleright \; \{ \mathit{substs} x_1 \} \; \ldots \; \oplus \mathit{substs} x_n \} \\ \hline \vdash (v_1, \ldots, v_n) \; \mathbf{matches} \; (\mathit{pat}_1, \ldots, \mathit{pat}_n) \; \triangleright \; \{ \mathit{substs} x_1 \} \; \ldots \; \oplus \mathit{substs} x_n \} \\ \hline \vdash (v_1, \ldots, v_n) \; \mathbf{matches} \; (\mathit{pat}_1, \ldots, \mathit{pat}_n) \; \triangleright \; \{ \mathit{substs} x_1 \} \; \ldots \; \oplus \mathit{substs} x_n \} \\ \hline \vdash (v_1, \ldots, v_n) \; \mathbf{matches} \; (\mathit{pat}_1, \ldots, \mathit{pat}_n) \; \triangleright \; \{ \mathit{substs} x_1 \} \; \ldots \; \vdash v_n \; \mathbf{matches} \; \mathit{pat}_n \; \triangleright \; \{ \mathit{substs} x_n \} \\ \hline \vdash v_1 \; \mathbf{matches} \; \mathit{pat}_1 \; \triangleright \; \{ \mathit{substs} x_n \} \; \\ \hline field\_\mathit{name}_1 \; \ldots \; field\_\mathit{name}_m \; \mathbf{distinct} \\ \hline \vdash \{ \mathit{field} \; \mathit{name}_1 \; = v_1 \; \ldots \; \mathit{field} \; \mathit{name}_m \; \mathbf{matches} \; \mathit{field}_n \; \mathbf{name}_n \; = v_n \} \; \mathbf{matches} \; \mathit{field}_n \; \mathbf{name}_n \; = v_n \} \; \mathbf{matches} \; \mathit{field}_n \; \mathbf{name}_n \; = v_n \} \; \mathbf{matches} \; \mathit{field}_n \; \mathbf{name}_n \; = v_n \} \; \mathbf{matches} \; \mathit{field}_n \; \mathbf{name}_n \; = v_n \} \; \mathbf{matches} \; \mathit{field}_n \; \mathbf{name}_n \; = v_n \} \; \mathbf{matches} \; \mathit{field}_n \; \mathbf{name}_n \; = v_n \} \; \mathbf{name}_n \; \mathbf{name}_n \; = v_n \} \; \mathbf{name}_n \; \mathbf{name}_n \; = v_n \} \; \mathbf{name}_n \; \mathbf{name}_n \; = v_n \; \mathbf{name}_n \; \mathbf{name}_n \; = v_n \; \mathbf{name}_n \;
```

4.3 recfun (letrec_bindings, pattern_matching) > expr Recursive function helper

Expands a recursive definition.

4.4 \vdash funval(e) Function values

Determines if an expression is a function value, for use in (Jbprim_equal_fun).

 $\frac{}{\vdash \mathbf{funval} ((\%\mathbf{prim} unary_prim))} \quad \mathsf{Jfunval_up}$ $\frac{}{\vdash \mathbf{funval} ((\%\mathbf{prim} binary_prim))} \quad \mathsf{Jfunval_bp}$

$$\frac{\vdash \mathbf{funval} ((\%\mathbf{prim} \mathit{binary_prim}) \, v)}{\vdash \mathbf{funval} (\mathbf{function} \, \mathit{pattern_matching})} \quad \mathsf{Jfunval_func}$$

4.5
$$\vdash unary_prim \ expr \xrightarrow{L} \ expr'$$
 Unary primitive evaluation

Computes the result of a unary primitive application.

$$\begin{array}{ccc} \hline \vdash \mathbf{not}\,\mathbf{true} & \longrightarrow \mathbf{false} \\ \hline \vdash \mathbf{not}\,\mathbf{false} & \longrightarrow \mathbf{true} \\ \hline \hline \vdash \mathbf{not}\,\mathbf{false} & \longrightarrow \mathbf{true} \\ \hline \hline \vdash \sim - \ \dot{n} & \longrightarrow 0 \ \dot{-} \ \dot{n} \\ \hline \end{array}$$

The effect of creating a reference is communicated to the store via the label on the reduction arrow. Similarly the reduction arrow carries the value read from the store when accessing a location.

$$\frac{}{\vdash \mathbf{ref} \; v \overset{\mathbf{ref} \; v = l}{\longrightarrow} \; l} \quad \text{Juprim_ref_alloc}$$

$$\frac{}{\vdash ! \; l \overset{!l = v}{\longrightarrow} \; v} \quad \text{Juprim_deref}$$

4.6 $\vdash expr_1 \ binary_prim \ expr_2 \stackrel{L}{\longrightarrow} expr$ Binary primitive evaluation

Computes the result of a binary primitive application.

$$\frac{\vdash \mathbf{funval}\left(v\right)}{\vdash v = v' \longrightarrow (\%\mathbf{primraise})\left(\mathbf{Invalid_argument}(\mathbf{equal_error_string})\right)} \quad \mathsf{Jbprim_equal_fun}$$

$$\frac{\vdash \mathit{constant} = \mathit{constant} \longrightarrow \mathbf{true}}{\vdash \mathit{constant} \neq \mathit{constant}'} \quad \mathsf{Jbprim_equal_const_false}$$

$$\frac{\mathit{constant} \neq \mathit{constant}'}{\vdash \mathit{constant} = \mathit{constant}' \longrightarrow \mathbf{false}} \quad \mathsf{Jbprim_equal_const_false}$$

$$\frac{\vdash l = l' \longrightarrow ((\%\mathbf{prim} =) \left((\%\mathbf{prim}!) \ l\right)) \left((\%\mathbf{prim}!) \ l'\right)}{\vdash \mathit{l} = l' \longrightarrow ((\%\mathbf{prim} =) \left((\%\mathbf{prim}!) \ l\right)) \left((\%\mathbf{prim}!) \ l'\right)} \quad \mathsf{Jbprim_equal_loc}$$

The side effect of an assignment is communicated to the store via the label on the reduction arrow.

$$\frac{}{\vdash l := v \xrightarrow{l := v} ()}$$
 Jbprim_assign

4.7 $\vdash expr with pattern_matching \longrightarrow pattern_matching'$

Pattern matching step

Proceeding to the next case because the first, but not only, case has failed to match.

$$\frac{\neg(v \text{ matches } pat)}{\operatorname{length}\left(e_{1}\right) \ldots\left(e_{n}\right) \geq 1} \\ \vdash v \text{ with } pat \rightarrow e|pat_{1} \rightarrow e_{1}| \ldots|pat_{n} \rightarrow e_{n} \longrightarrow pat_{1} \rightarrow e_{1}| \ldots|pat_{n} \rightarrow e_{n}} \quad \mathsf{JRmatching_next}$$

4.8 $\vdash expr \text{ with } pattern_matching \longrightarrow expr'$ Pattern matching finished

Proceeding to an expression because the first case matches, or the only case does not match.

$$\begin{array}{c|c} \vdash v \ \mathbf{matches} \ pat & \rhd \ \{\!\!\{x_1 \!\!\leftarrow\!\! v_1, \ldots, x_m \!\!\leftarrow\!\! v_m\}\!\!\} \\ \hline \vdash v \ \mathbf{with} \ pat \to e | pat_1 \to e_1 | \ldots | pat_n \to e_n \longrightarrow \{\!\!\{x_1 \!\!\leftarrow\!\! v_1, \ldots, x_m \!\!\leftarrow\!\! v_m\}\!\!\} e \\ \hline \hline \neg (v \ \mathbf{matches} \ pat) \\ \hline \vdash v \ \mathbf{with} \ pat \to e \longrightarrow (\% \mathbf{primraise}) \ \mathbf{Match_failure} \end{array} \ \mathsf{JRmatching_fail}$$

4.9 $\vdash expr \xrightarrow{L} expr'$ Expression evaluation

Reduces an expression one-step. Most evaluation contexts require two rules, one for normal evaluation and one for exception propagation.

$$\frac{\vdash unary_prim\ v\ \stackrel{L}{\longrightarrow}\ e}{\vdash (\%\mathbf{prim}\,unary_prim)\ v\ \stackrel{L}{\longrightarrow}\ e}\ \mathsf{JR_expr_uprim}$$

$$\frac{\vdash v_1\ binary_prim\ v_2\ \stackrel{L}{\longrightarrow}\ e}{\vdash ((\%\mathbf{prim}\,binary_prim)\ v_1)\ v_2\ \stackrel{L}{\longrightarrow}\ e}\ \mathsf{JR_expr_bprim}$$

$$\frac{\vdash (e:t)\ \longrightarrow\ e}{\vdash (e:t)\ \longrightarrow\ e}\ \mathsf{JR_expr_typed_ctx}$$

Right-to-left evaluation order for application (i.e., argument before function).

$$\frac{\vdash e_0 \stackrel{L}{\longrightarrow} e_0'}{\vdash e_1 \ e_0 \stackrel{L}{\longrightarrow} e_1 \ e_0'} \quad \mathsf{JR_expr_apply_ctx_arg}$$

```

```

$$\vdash$$
 if false then e_2 else $e_3 \longrightarrow e_3$

We treat matching one pattern against one value as atomic (this would be relevant when matching the contents of a reference after introducing concurrent evaluation).

We specify the evaluation of e_1 before e_2 in **for** loops, which appears to follow the implementation.

$$\begin{array}{c} \vdash e_1 \stackrel{L}{\longrightarrow} e_1' \\ \hline \vdash \text{for } x = e_1 \, [\text{down}] \text{to } e_2 \, \text{do } e_3 \, \text{done} \stackrel{L}{\longrightarrow} \text{for } x = e_1' \, [\text{down}] \text{to } e_2 \, \text{do } e_3 \, \text{done} \\ \hline \hline \vdash \text{for } x = (\% \text{primraise}) \, v \, [\text{down}] \text{to } e_2 \, \text{do } e_3 \, \text{done} \longrightarrow (\% \text{primraise}) \, v \\ \hline \hline \vdash \text{for } x = (\% \text{primraise}) \, v \, [\text{down}] \text{to } e_2 \, \text{do } e_3 \, \text{done} \longrightarrow (\% \text{primraise}) \, v \\ \hline \hline \vdash \text{for } x = v_1 \, [\text{down}] \text{to } e_2 \, \text{do } e_3 \, \text{done} \stackrel{L}{\longrightarrow} \text{for } x = v_1 \, [\text{down}] \text{to } e_2' \, \text{do } e_3 \, \text{done} \\ \hline \hline \vdash \text{for } x = v \, [\text{down}] \text{to } (\% \text{primraise}) \, v' \, \text{do } e_3 \, \text{done} \longrightarrow (\% \text{primraise}) \, v' \\ \hline \hline \vdash \text{for } x = v \, [\text{down}] \text{to } (\% \text{primraise}) \, v' \, \text{do } e_3 \, \text{done} \longrightarrow (\% \text{primraise}) \, v' \\ \hline \hline \vdash \text{for } x = \dot{n}_1 \, \text{to } \dot{n}_2 \, \text{do } e \, \text{done} \longrightarrow (\text{let } x = \dot{n}_1 \, \text{in } e); \text{for } x = \dot{n}_1 \, \dot{+} \, 1 \, \text{to } \dot{n}_2 \, \text{do } e \, \text{done} \\ \hline \hline \end{bmatrix} \text{JR_expr_for_to_do}$$

$$\frac{}{\vdash ((\%\mathbf{primraise}) \, v) :: \, v' \, \longrightarrow \, (\%\mathbf{primraise}) \, v} \quad \mathsf{JR_expr_cons_raise2}$$

We specify right-to-left evaluation for records. The bytecode implementation appears to go right to left after first reordering the record to correspond to the field ordering in the record type definition.

The bytecode implementation appears to evaluate the leftmost position first in with expressions, so we follow that here.

$$\frac{L}{\vdash \{v \text{ with } fn_1 = e_1; \dots; fn_m = e_m; field_name = e; fn'_1 = v_1; \dots; fn'_n = v_n\}} \xrightarrow{L} \text{JR_expr_record_with_ctx1}$$

4.11 store(location) > expr Store lookup

Gets the value stored at a given location.

$$\begin{array}{c|c} st(l) \vartriangleright e' \\ \hline l \neq l' \\ \hline st, l' \mapsto e(l) \vartriangleright e' \end{array} \mbox{ JSstlookup_rec} \\ \hline \hline st, l \mapsto e(l) \vartriangleright e \end{array}$$

4.12 $\vdash store \xrightarrow{L} store'$ Store transition

Coordinates a store with a label.

$$\begin{array}{c|c} \hline -st \longrightarrow st \\ \hline & st(l) \vartriangleright v \\ \hline -st \stackrel{!l=v}{\longmapsto} st \\ \hline & JRstore_lookup \\ \hline & st'(l) \, \mathbf{unallocated} \\ \hline & \vdash st, l \mapsto expr, st' \stackrel{l:=v}{\longrightarrow} st, l \mapsto \mathbf{remv_tyvar} \, v, st' \\ \hline & \frac{st(l) \, \mathbf{unallocated}}{\vdash st \stackrel{\mathbf{ref} \, v=l}{\longrightarrow} st, l \mapsto \mathbf{remv_tyvar} \, v} \quad \mathsf{JRstore_assign} \\ \hline & \frac{st(l) \, \mathbf{unallocated}}{\vdash st \stackrel{\mathbf{ref} \, v=l}{\longrightarrow} st, l \mapsto \mathbf{remv_tyvar} \, v} \quad \mathsf{JRstore_alloc} \\ \hline \end{array}$$

4.13 $\vdash \langle definitions, program, store \rangle \longrightarrow \langle definitions', program', store' \rangle$ Top-level reduction

The semantics of a machine is described as the parallel evolution of a structure body (the program) and a store. Each program evaluation step labelled L must be matched by a store evaluation step with the same label.

$$\begin{array}{c} \vdash store \stackrel{L}{\longrightarrow} store' \\ \frac{\vdash \langle definitions_value, program \rangle \stackrel{L}{\longrightarrow} \langle definitions, program' \rangle}{\vdash \langle definitions_value, program, store \rangle \longrightarrow \langle definitions, program', store' \rangle} \end{array} \text{ JRtop_defs}$$

4.14 $\vdash expr$ behaves Expression behaviour

This relation describes expressions whose behaviour is defined. This includes values, expressions that reduce, and raised exceptions. An expression with no behaviour is said to be stuck. In this definition of expression behaviour, we treat any reducing expression as behaving, no matter what (satisfiable) constraint is imposed on the label.

$$\begin{array}{c} \hline \vdash v \ \mathbf{behaves} \\ \hline \vdash e \ \stackrel{L}{\longrightarrow} \ e' \\ \hline \vdash e \ \mathbf{behaves} \\ \hline \hline \vdash (\%\mathbf{primraise}) \ v \ \mathbf{behaves} \\ \hline \end{array} \ \ \begin{array}{c} \mathsf{JRB_ebehaviour_reduces} \\ \hline \mathsf{JRB_ebehaviour_raises} \\ \hline \end{array}$$

4.15 $\vdash \langle definitions, program, store \rangle$ behaves structure body behaviour

As for expressions, a definition sequence behaves if it is a value, if it reduces (under any label), or if it raises an exception.
